Data Sheet

ACPL-C87AT/ACPL-C87BT

Automotive High Precision DC Voltage Isolation Sensor

Description

The Broadcom® ACPL-C87AT/C87BT isolation sensors utilize superior optical coupling technology, with sigma-delta (Σ-Δ) analog-to-digital converter, chopper stabilized amplifiers, and a fully differential circuit topology to provide unequaled isolation-mode noise rejection, low offset, high gain accuracy and stability.

ACPL-C87AT (±1% gain tolerance) and ACPL-C87BT (±0.5% gain tolerance) are designed for high precision DC voltage sensing in electronic motor drives, DC/DC and AC/DC converter and battery monitoring system. The ACPL-C87AT/C87BT features high input impedance and operate with full span of analog input voltage up to 2.46V. The shutdown feature provides power saving and can be controlled from external source, such as microprocessor.

The high common-mode transient immunity (15 kV/µs) of the ACPL-C87AT/C87BT maintains the precision and stability needed to accurately monitor DC rail voltage in high noise motor control environments. This galvanic safe isolation solution is delivered in a compact, surface mount stretched SO-8 (SSO-8) package that meets worldwide regulatory safety standards.

Broadcom R^2Coupler® isolation products provide the reinforced insulation and reliability needed for critical automotive and high temperature industrial applications.

Features

- Unity gain
- ± 0.5% (ACPL-C87BT) and ± 1% (ACPL-C87AT) gain tolerance @ 25°C
- –0.3 mV Input offset voltage
- 0.05% non linearity
- 25 ppm/°C gain drift vs. temperature
- 100 kHz bandwidth
- 0 to 2V nominal input range
- Qualified to AEC-Q100 Grade 1 test guidelines
- Operating temperature: –40°C to +125°C
- Shutdown feature (active high)
- 15 kV/µs common-mode rejection at V_{CM} = 1 kV
- Working voltage, V_{IORM} = 1414 V_{peak}
- Compact, surface mount stretched SO8 package
- Worldwide safety approval:
  - UL 1577 (5000 V_{RMS}/1 minute)
  - CSA
  - IEC/EN/DIN EN 60747-5-5

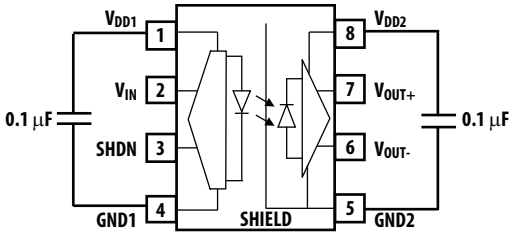
Applications

- Automotive BMS battery pack voltage sensing
- Automotive DC/DC converter voltage sensing
- Automotive motor inverter DC bus voltage sensing
- Automotive AC/DC (charger) DC output voltage sensing
- Isolation interface for temperature sensing
- General-purpose voltage sensing and monitoring

CAUTION! Take normal static precautions in handling and assembly of this component to prevent damage and/or degradation which may be induced by ESD.

Functional Diagram

Figure 1: Functional Diagram



A 0.1-µF bypass capacitor must be connected between pin 1 and pin 4, and pin 5 and pin 8 as shown.

Figure 2: Functional Diagram 2

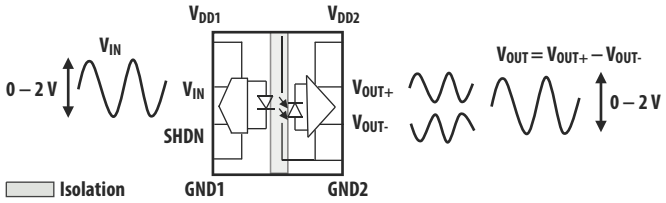


Figure 3: Typical Voltage Sensing Circuit

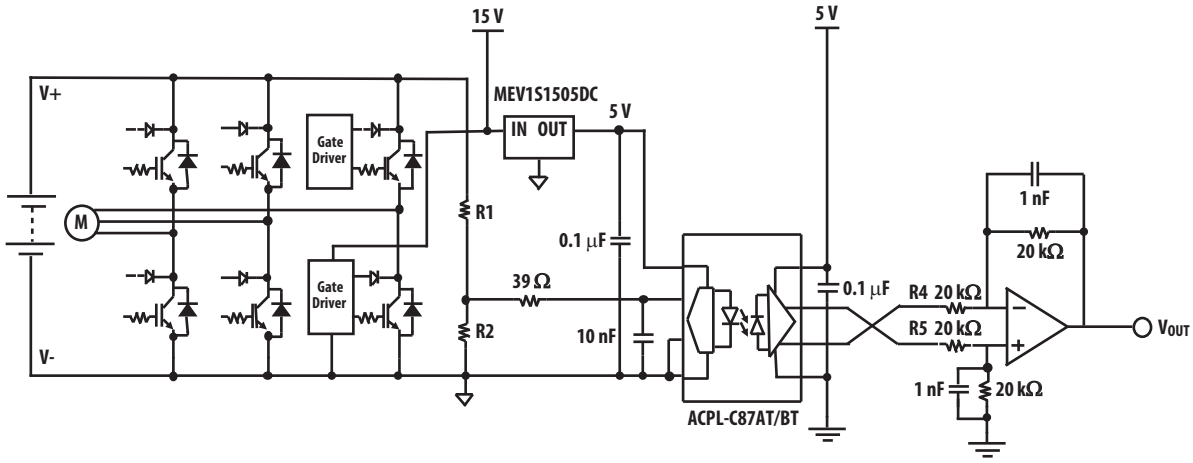

Figure 4: Package Pinout

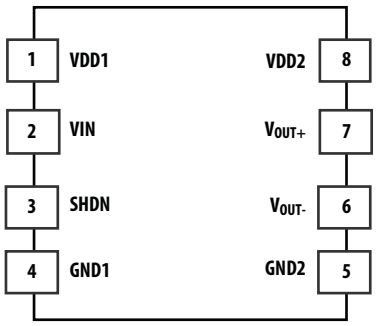


Pin Description

Pin Number	Pin Name	Description	Pin Number	Pin Name	Description
1	V_{DD1}	Input power supply When V_{DD1} = 0, then V_{OUT+} = 0V, V_{OUT-} = 2.6V	8	V_{DD2}	Output power supply
2	V_{IN}	Voltage input, full scale range = 2.46V	7	V_{OUT+}	Positive output voltage
3	SHDN	Shutdown (active high) When active, then V_{OUT+} = 0V, V_{OUT-} = 2.6V	6	V_{OUT-}	Negative output voltage
4	GND1	Input side ground	5	GND2	Output side ground

Ordering Information

Part Number	Option (RoHS Compliant)	Package	Surface Mount	Tape and Reel	UL 5000 V_{rms} / 1 Minute rating	IEC/EN/DIN EN 60747-5-5	Quantity
ACPL-C87AT	-000E	Stretched SO-8	X		X	X	80 per tube
ACPL-C87BT	-500E		X	X	X	X	1000 per reel

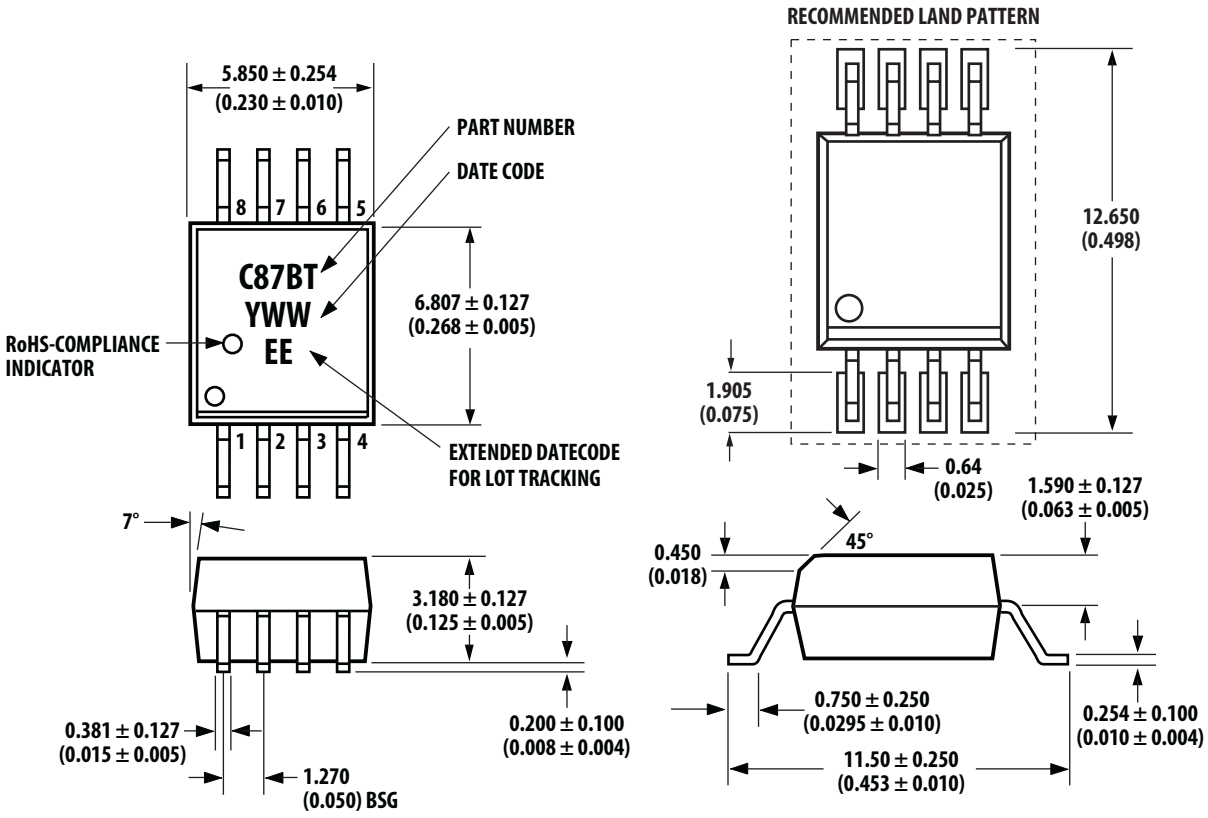
To order, choose a part number from the part number column and combine with the desired option from the option column to form an order entry.

Example:

ACPL-C87AT-500E to order product of SSO-8 Surface Mount package in Tape and Reel packaging with RoHS compliant. Contact your Broadcom sales representative or authorized distributor for information.

Package Outline Drawing (Stretched SO8)

Figure 5: Package Outline Drawing



Dimensions in millimeters and (inches).

Note:
Lead coplanarity = 0.1 mm (0.004 inches).
Floating lead protrusion = 0.25mm (10mils) max.

Recommended Pb-Free IR Profile

Recommended reflow condition as per JEDEC Standard, J-STD-020 (latest revision).

NOTE: Use non-halide flux.

Regulatory Information

The ACPL-C87AT and ACPL-C87BT are approved by the following organizations.

UL	CSA	IEC/EN/DIN EN 60747-5-5
UL 1577, component recognition program up to V_{ISO} = 5kV_{RMS}	Approved under CSA Component Acceptance Notice #5.	IEC 60747-5-5 EN 60747-5-5 DIN EN 60747-5-5

Power Supply Rejection	PSR	—	–78	—	dB	1 Vp-p, 1 kHz sine wave ripple on V_{DD1}, differential output		
Common Mode Transient Immunity	CMTI	10	15	—	kV/µs	V_{CM} = 1 kV, T_A = 25°C	24	b

a. Noise is measured at the output of the differential to single ended post amplifier.

b. Common mode transient immunity (CMTI) is tested by applying a fast rising/falling voltage pulse across GND1 (pin 4) and GND2 (pin 5). The output glitch observed is less than 0.2V from the average output voltage for less than 1 µs.

Package Characteristics

Unless otherwise noted, all typical values are at T_A = 25°C; all Minimum/Maximum specifications are at Recommended Operating Conditions.

Parameter	Symbol	Min.	Typ.	Max.	Units	Test Conditions	Figure	Note
Input-Output Momentary Withstand Voltage[a]	V_{ISO}	5000	—	—	V_{RMS}	RH < 50%, t = 1 minute, T_A = 25°C		b, c
Input-Output Resistance	R_{I-O}	—	10^{14}	—	Ω	V_{I-O} = 500 V_{DC}		b
Input-Output Capacitance	C_{I-O}	—	0.5	—	pF	f =1 MHz		b

a. The Input-Output Momentary Withstand Voltage is a dielectric voltage rating that should not be interpreted as an input-output continuous voltage rating.

b. Device considered a two terminal device: pins 1, 2, 3, and 4 shorted together, and pins 5, 6, 7, and 8 shorted together.

c. In accordance with UL 1577, each optocoupler is proof tested by applying an insulation test voltage ≥ 6000 V_{RMS} for 1 second.

Typical Characteristic Plots and Test Conditions

All ±3σ plots are based on characterization test result at the point of product release. For guaranteed specification, refer to the respective Electrical Specifications section.

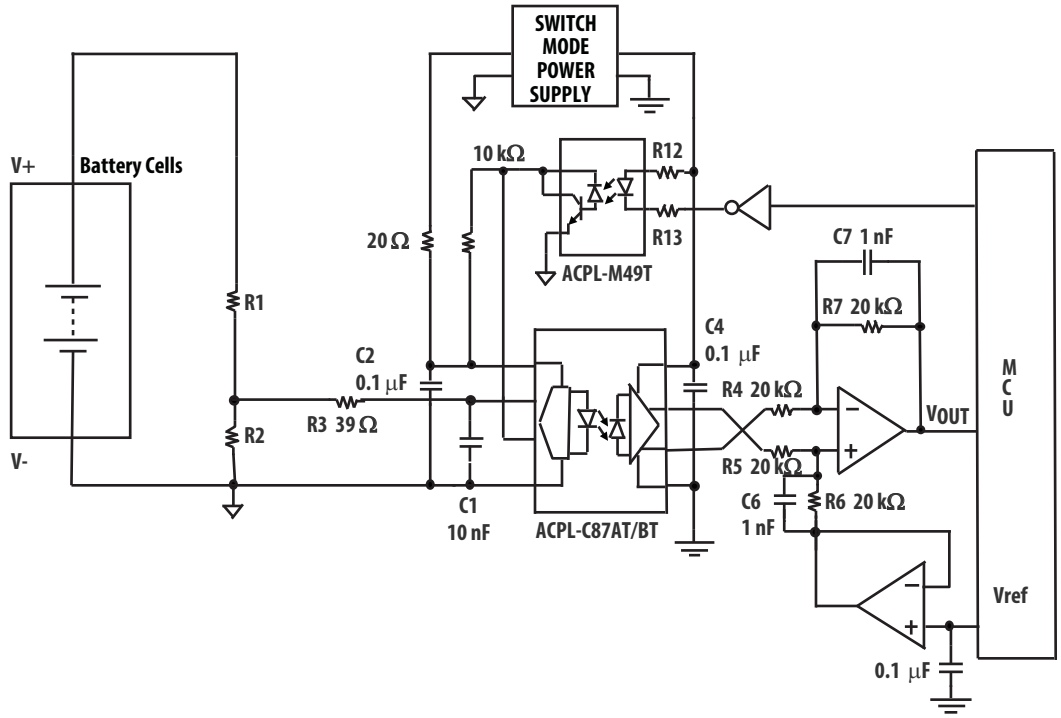
Application Information

The circuit shown in the Figure 28 is a high voltage sensing application using ACPL-C87AT/BT (isolation amplifier) and ACPL-M49T (optocoupler). The high voltage input is sensed by the precision voltage divider resistors R1 and sensing resistor R2. The ratio of the voltage divider is determined by the allowable input range of the isolation amplifier (0 to 2 V). This small analog input goes through a 39Ω and 10 nF anti aliasing filter (ACPL-C87AT/BT use Σ-Δ modulation).

Inside the isolation amplifier: the analog input signal is digitized and optically transmitted to the output side of the amplifier. The detector will then decode the signal and converted back to analog signal. The output differential signals of ACPL-C87AT/BT go through an op-amp to convert the differential signals to a single ended output.

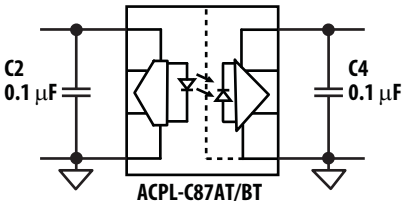
Figure 28: Typical Application Circuit for Battery Voltage Sensing



Bypass Capacitor

A 0.1-µF bypass capacitor must be connected as near as possible between V_{DD1} to GND1 and V_{DD2} to GND2 (Figure 29).

Figure 29: Bypass Capacitors C2, C4



Anti-aliasing Filter

A 39Ω resistor and a 10-nF capacitor are recommended to be connected to the input (V_{IN}) as anti-aliasing filter because ACPL-C87AT/BT uses sigma data modulation (Figure 30). The value of the capacitor must be greater than 1 nF and bandwidth must be less than 410 kHz.

Figure 30: Anti-aliasing Filter C1, R3

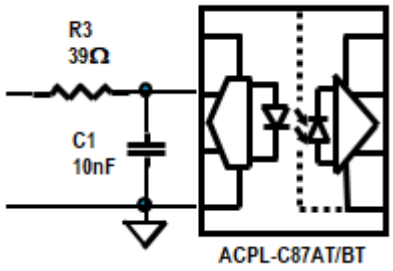


Figure 31: Loading Resistors R4, F5

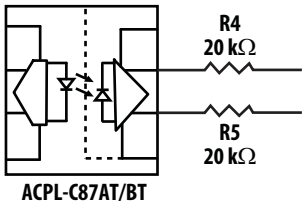


Designing the Input Resistor Divider

1. Choose the sensing current (Isense) for bus voltage; for example, 1 mA.
2. Determine R2,

$$R_2 = \frac{\text{Voltage input range}}{I_{SENSE}} = \frac{2\ V}{1\ mA} = 2\ k\Omega$$

3. Determine R1 using voltage divider formula:

$$(V+ - V-) \bullet \frac{R_2}{R_1 + R_2} = \text{Voltage input range, or}$$

$$R_1 = \frac{(V+ - V-) \bullet R_2}{\text{Voltage input range}} - R_2$$

where (V+ – V-) is the high voltage input; for example, 0 to 600V,

$$R_1 = \frac{(600\ V - 0\ V) \bullet 2\ k\Omega}{2\ V} - 2\ k\Omega = 598\ k\Omega$$

To reduce the voltage stress of a sole resistor, R1 can be a series of several resistors.

Post Amplifier Circuit

The output of ACPL-C87AT/BT is a differential output (V_{OUT+} and V_{OUT-} pins). A post amplifier circuit is needed to convert the differential output to single ended output with a reference ground. The post amplifier circuit can also be configured to establish a desired gain if needed. It also functions as filter to high frequency chopper noise. The bandwidth can be adjusted by changing the feedback resistor and capacitor (R7 and C7). Adjusting this bandwidth to a minimum level helps minimize the output noise.

Post op-amp resistive loading (R4, R5) should be equal or greater than 20 kΩ (Figure 31). Resistor values lower than this can affect the overall system error due to output impedance of isolation amplifier.

The application circuit in Figure 28 features two op-amps to improve the linearity at voltage near 0V caused by the limited headroom of the amplifier. The second op-amp can set the reference voltage to above 0V.

Shutdown Function

ACPL-C87AT/BT has a shutdown function to disable the device and make the output ($V_{OUT+} - V_{OUT-}$) low. A voltage of 5V on SHDN pin will shutdown the device producing an output ($V_{OUT+} - V_{OUT-}$) of –2.6V. To be able to control the SHDN function (example, from microprocessor), an optocoupler (ACPL-M49T) is used.

Total System Error

Total system error is the sum of the resistor divider error, isolation amplifier error and post amplifier error. The resistor divider error is due to the accuracy of the resistors used. It is recommended to use high accuracy resistor of 0.1%. Post amplifier error is due to the resistor matching and the voltage offset characteristic which can be found on the supplier data sheet.

Isolation Amplifier Error is shown in the following table.

Isolation Amplifier Error Calculation

			3σ Distribution or Specification[a]			
		Typical	ACPL-C87AT	ACPL-C87BT		Figure
A	Error due to offset voltage (25°C)	0.015%	0.5%	0.5%	Offset Voltage /Recommended input voltage range (2.0V)	specs
B	Error due to offset voltage drift (across temperature)	0.1%	0.4%	0.4%	Offset Voltage /Recommended input voltage range (2.0V)	
C	Error due to gain tolerance (25°C)	0%	1%	0.5%		specs
D	Error due to gain drift (across temperature)	0.25%	0.8%	0.8%		
E	Error due to Nonlinearity (across temperature)	0.05%	0.12%	0.12%		
F	**Total uncalibrated error (A+B+C+D+E)**	0.415%	2.82%	2.32%		specs
G	**Total offset calibrated error (F – A)**	0.4%	2.32%	1.82%		
H	**Total gain and offset calibrated error (G – C)**	0.4%	1.32%	1.32%		

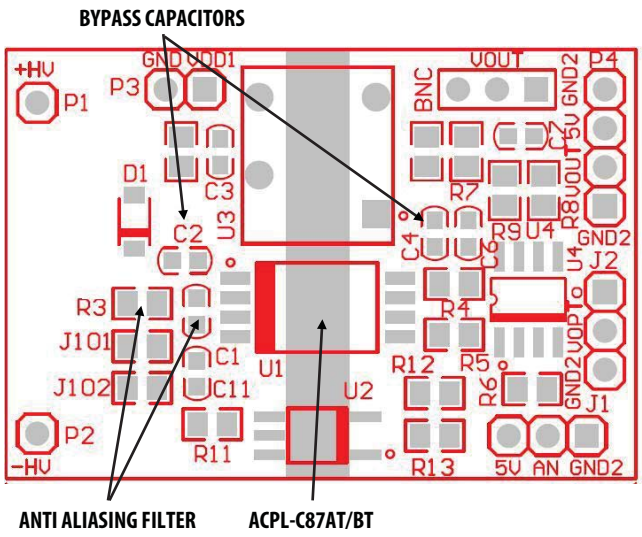
a. 3σ distribution is based on corner wafers.

PCB Layout Recommendations

Bypass capacitor C2 and C4 must be located close to ACPL-C87xT Pins 1 and Pin 8 respectively. Grounded pins of C4 and C5 can be connected by vias through the respective ground layers. If the design has multiple layers, a dedicated layer for ground is recommended for flexibility in component placement.

Anti aliasing filters R3 and C1 also need to be connected as close as possible to Pin 2 of ACPL-C87AT/BT. See Figure 32 for actual component placement of the anti-aliasing filter and bypass capacitors.

Figure 32: Component Placement Recommendation



GND1 and GND2 must be totally isolated in the PCB layout (Figure 33). Distance of separation depends on the high voltage level of the equipment. The higher the voltage level, the larger the distance of separation needed. Designers can refer to specific IEC standard of their equipment for the creepage/clearance requirements.

R1, which is directly connected to the high voltage input, must have sufficient clearance with the low voltage components. Clearance depends on the high voltage level of the input. Designers can refer to specific IEC standards of their equipment for the clearance requirements.

Figure 33: Bottom Layer Layout Recommendation
