

Features

- 3.3 V, 5.0 V, 12 V, and Adjustable Output Versions
- Adjustable version output voltage range, 1.23V to 57V $\pm$ 4% max over line and load conditions
- Output load current: 3A
- Input voltage range up to 60V
- Requires only 4 external components
- 52 kHz fixed frequency internal oscillator
- TTL shutdown capability, low power standby mode
- High efficiency
- Thermal shutdown and current limit protection
- Built-in switching transistor on chip
- 5-lead T0-220 package

Applications

- Simple High-Efficiency Step-Down (Buck) Regulator
- Efficient Pre-Regulator for Linear Regulators
- On-Card Switching Regulators
- Positive to Negative Converter (Buck-Boost)
- Negative Step-Up Converters
- Power Supply for Battery Chargers

General Description

The CBM2576HVSseries of regulators are monolithic integrated circuits that provide all the active functions for a step-down (buck) switching regulator, capable of driving 3A load with excellent line and load regulation. These devices are available in fixed output voltages of 3.3V, 5.0V, 12V, and adjustable output version. Requiring a minimum number of external components, these regulators are simple to use and include internal frequency compensation and a fixed-frequency oscillator.

The CBM2576HVSseries offers a high-efficiency replacement for popular three-terminal linear regulators. It substantially reduces the size of the heat sink, and in some cases no heat sink is required. A standard series of inductors optimized for use with the CBM2576HVSare available from several different manufacturers. This feature greatly simplifies the design of switch-mode power supplies.

Other features include a guaranteed $\pm 4\%$ tolerance on output voltage within specified input voltages and output load conditions, and $\pm 10\%$ on the oscillator frequency. The external shutdown function can be controlled by logic level and then come into standby mode. The output switch includes cycle-by-cycle current limiting, as well as thermal shutdown for full protection under fault conditions.

The CBM2576HVS series are available in a standard 5-lead T0-220 package.

Pin Configuration

T0220-5

Pin Assignment

T0263-5

Num	Symbol	I/O	Description
1	VIN	I	Supply input pin to collector pin of high-side transistor. Connect to power supply and input bypass capacitors CIN. Path from VIN pin to high frequency bypass CIN and GND must be as short as possible.
2	OUTPUT	O	Emitter pin of the power transistor. This is a switching node. Attached this pin to an inductor and the cathode of the external diode.
3	GND	--	Ground pin. Path to CIN must be as short as possible.
4	FEEDBACK	I	Feedback sense input pin. Connect to the midpoint of feedback divider to set VOUT for ADJ version or connect this pin directly to the output capacitor for a fixed output version.
5	ON/OFF	I	Enable input to the voltage regulator. High = OFF and low = ON. Connect to GND to enable the voltage regulator. Do not leave this pin float.package.

Block diagram

Figure 1.

3.3V $R_2 = 2.02k$

5.0V, $R_2 = 3.69k$

12V, $R_2 = 10.56k$

For adjustable version $R_1 = \text{Open}$, $R_2 = \text{on}$

Typical Electrical Parameters

Parameter, unit		Symbol	Typ. value	Test condition
Efficiency,%	CBM2576HVS-ADJ		77	$V_{IN} = 12V, I_{LOAD} = 3A, V_{OUT} = 5V$
	CBM2576HVS-3.3		75	$V_{IN} = 12V, I_{LOAD} = 3A$
	CBM2576HVS-5.0		77	
	CBM2576HVS-12		88	$V_{IN} = 15V, I_{LOAD} = 3A$
Max. Duty Cycle (ON), %		DC_{MAX}	98	$V_{FB} = 0V$

Typical Application (Fixed Output voltage versions)

- C₁—aluminum electrolytic capacitor(100uF, 75V)
 C₂—aluminum electrolytic capacitor(1000uF, 25V)
 L₁—inductor (100uH)
 D₁—Schottky diode

$$V_{OUT} = V_{ref} \left(1 + \frac{R_2}{R_1} \right), R_2 = R_1 \left(\frac{V_{OUT}}{V_{ref}} \right) - 1th$$

Where V_{ref}=1.23V, R₁ between 1.0k and 5.0k

C₁ = 10 nF

C₂ = 1 nF

Absolute Maximum Ratings

(Absolute Maximum Ratings indicate limits beyond which damage to the device may occur.)

Rating	Symbol	Value	Unit
Maximum Supply Voltage	V_{IN}	63	V
ON/OFF Pin Input Voltage		$-0.3V \leq V \leq +25$	V
Output Voltage to Ground (Steady-State)		-0.1	V
Power Dissipation			
TO-220,5-Lead	P_D	Internally Limited	W
• Thermal Resistance, Junction-to-Ambient	$R_{\theta JA}$	65	°C/W
• Thermal Resistance, Junction-to-Case	$R_{\theta JC}$	5.0	°C/W
T0-263, 5-Lead (D2PAK)	P_D	Internally Limited	W
• Thermal Resistance, Junction-to-Ambient	$R_{\theta JA}$	70	°C/W
• Thermal Resistance, Junction-to-Case	$R_{\theta JC}$	5.0	°C/W
Storage Temperature Range	T_{STG}		°C
Minimum ESD Rating (Human Body Model: $C=100pF, R=1.5k\Omega$)		2.0	kV
Lead Temperature (Soldering, 10 seconds)		260	°C
Maximum Junction Temperature	T_J	150	°C

* Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied.

Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

Operating Ratings

(Operating Ratings indicate conditions for which the device is intended to be functional, but do not guarantee specific performance limits. For guaranteed specifications and test conditions, see the Electrical Characteristics.)

Rating	Symbol	Value	Unit
Operating Junction Temperature Range	T_J	-40 to +125	°C
Supply Voltage	V_{IN}	60	V

Electrical Characteristics

(Unless otherwise specified, $V_{IN} = 12V$ for the 3.3V, 5.0V, and Adjustable version, $V_{IN} = 25V$ for the 12V version, and $V_{IN} = 30V$ for the 15V version. $I_{LOAD} = 500mA$, $T_J = 25^\circ C$, for min/max values T_J is the operating junction temperature range that applies unless otherwise noted)

* Junction temperature. Junction temperature is equal to ambient because of measurements of electric parameters are executed in pulse mode.

Application Information

Inverting Regulator

Figure 4 shows a CBM2576-12 in a buck-boost configuration to generate a negative 12V output from a positive input voltage. This circuit bootstraps the regulator's ground pin to the negative output voltage, then by grounding the feedback pin, the regulator senses the inverted output voltage and regulates it to -12V.

For an input voltage of 12V or more, the maximum available output current in this configuration is approximately 700 mA. At lighter loads, the minimum input voltage required drops to approximately 4.7V.

The switch currents in this buck-boost configuration are higher than in the standard buck-mode design, thus lowering the available output current. Also, the start-up input current of the buck-boost converter is higher than the standard buck-mode regulator, and this may overload an input power source with a current limit less than 5A. Using a delayed turn-on or an undervoltage lockout circuit (described in the next section) would allow the input voltage to rise to a high enough level before the switcher would be allowed to turn on.

Because of the structural differences between the buck and the buck-boost regulator topologies, the buck regulator design procedure section can not be used to select the inductor or the output capacitor. The recommended range of inductor values for the buck-boost design is between 68μH and 220μH, and the output capacitor values must be larger than what is normally required for buck designs. Low input voltages or high output currents require a large value output capacitor (in the thousands of micro Farads).

The peak inductor current, which is the same as the peak switch current, can be calculated from the following formula:

$$I_P = \frac{I_{LOAD}(V_{IN}+V_{|O|})}{V_{IN}} + \frac{V_{IN}|V_O|}{V_{IN}+|V_O|} \times \frac{1}{2L_1F_{OSC}}$$

Where $f_{OSC} = 52 \text{ kHz}$. Under normal continuous inductor current operating conditions, the minimum V_{IN} represents the worst case. Select an inductor that is rated for the peak current anticipated.

FIGURE 4. Inverting Buck-Boost Develops -12V

Also, the maximum voltage appearing across the regulator is the absolute sum of the input and output voltage. For a -12V output, the maximum input voltage for the IL2576 is +28V.

NEGATIVE BOOST REGULATOR

Another variation on the buck-boost topology is the negative boost configuration. The circuit in Figure 5 accepts an input voltage ranging from -5V to -12V and provides a regulated -12V output. Input voltages greater than -12V will cause the output to rise above -12V, but will not damage the regulator.

Typical Load Current

400 mA for $V_{IN} = -5.2V$

750 mA for $V_{IN} = -7V$

Note: Heat sink may be required

FIGURE 5. Negative Boost

Because of the boosting function of this type of regulator, the switch current is relatively high, especially at low input voltages.

Output load current limitations are a result of the maximum current rating of the switch. Also, boost regulators can not provide current limiting load protection in the event of a shorted load, so some other means (such as a fuse) may be necessary.

UNDERVOLTAGE LOCKOUT

In some applications it is desirable to keep the regulator off until the input voltage reaches a certain threshold. An undervoltage lockout circuit which accomplishes this task is shown in Figure 6 while Figure 7 shows the same circuit applied to a buck-boost configuration. These circuits keep the regulator off until the input voltage reaches a predetermined level.

$$V_{TH} = V_{Z1} + 2V_{BE}(Q1)$$

Note: Complete circuit not shown

FIGURE 6. Undervoltage Lockout for Buck Circuit

FIGURE 7. Undervoltage Lockout for Buck-Boost Circuit

DELAYED STARTUP

The ON /OFF pin can be used to provide a delayed startup feature as shown in Figure 8. With an input voltage of 20V and for the part values shown, the circuit provides approximately 10 ms of delay time before the circuit begins switching

Increasing the RC time constant can provide longer delay times. But excessively large RC time constants can cause problems with input voltages that are high in 60Hz or 120Hz ripple, by coupling the ripple into the ON /OFF pin.

FIGURE 8. Delayed Startup

ADJUSTABLE OUTPUT, LOW-RIPPLE POWER SUPPLY

A 3A power supply that features an adjustable output voltage is shown in Figure 9. An additional L-C filter that reduces the output ripple by a factor of 10 or more is included in this circuit.

FIGURE 9. Adjustable 3A Power Supply with Low Output Ripple

Definition of Terms

BUCK REGULATOR

A switching regulator topology in which a higher voltage is converted to a lower voltage. Also known as a step-down switching regulator.

BUCK-BOOST REGULATOR

A switching regulator topology in which a positive voltage is converted to a negative voltage without a transformer.

DUTY CYCLE (D)

Ratio of the output switch's on-time to the oscillator period.

$$\text{for buck regulator } D = \frac{t_{\text{ON}}}{T} = \frac{V_{\text{OUT}}}{V_{\text{IN}}}$$

$$\text{for buck-boost regulator } D = \frac{t_{\text{ON}}}{T} = \frac{|V_0|}{|V_0| + V_{\text{IN}}}$$

CATCH DIODE OR CURRENT STEERING DIODE

The diode which provides a return path for the load current when the IL2576 switch is OFF.

EFFICIENCY (η)

The proportion of input power actually delivered to the load.

$$\eta = \frac{P_{\text{OUT}}}{P_{\text{IN}}} = \frac{P_{\text{OUT}}}{P_{\text{OUT}} + P_{\text{LOSS}}}$$
