

# **Cli**3<sup>™</sup>

# **Highlights & Features**

- Universal AC input voltage range
- Built-in active PFC and up to 94% efficiency
- Full power from -25°C to +60°C operation @ 5000m or 16400 ft. altitude
- Power Boost of 150% up to 7 seconds
- Advanced Power Boost (APB) protect system and ensure continuing operation when large inrush current detected due to faulty load on a multiple load connection
- DNV GL and ABS approval for maritime applications
- Built-in DC OK Contact and LED indicator for DC OK/ Overload
- Conformal coating on PCBAs to protect against common dust and chemical pollutants

### **Safety Standards**

CB Certified for worldwide use

Model Number: Unit Weight: Dimensions (L x W x D): 124 x 60 x 117 mm

DRM-24V240W1PN 0.94 kg (2.07 lb) (4.88 x 2.36 x 4.61 inch)

### **General Description**

Delta Electronics is introducing one of the slimmest DIN rail industrial power supplies in its class, the CliQ M DIN rail power supply series. To fulfill the demands in maritime applications, the product is designed according to major industrial and maritime (Lloyd's Register) safety standards. Other features include compliance with harmonic current IEC/EN 61000-3-2, class A. In addition to having Power Boost of 150% for 5 seconds, the CliQ M series is the first in the CliQ family to feature Advanced Power Boost (APB). With multiple loads connected in a system, a large outrush current could be drawn (demanded) due to one fault load. This will be detected by APB. The APB will trip the circuit breaker (circuit breaker with appropriate rating based on the system load) on the current path of the fault load due to high current. This thus prevents the system from shutting down while the other connected current paths continue to operate without interruption. Additionally, the product also includes built-in DC OK contact and LED indicator for DC OK/ Overload.

### **Model Information**

### CliQ M DIN Rail Power Supply

Model Number	Input Voltage Range	Rated Output Voltage	Rated Output Current
DRM-24V240W1PN	85-276Vac (88-375Vdc)	24Vdc	10.0A

# **Model Numbering**

1

DR	M —	24V	240W	1	Р	Ν
DIN Rail	CliQ M Series	Output Voltage	Output Power	Single Phase	Advanced Power Boost (APB)	N - Metal Case, without Class I, Div 2 and ATEX approvals

# **Specifications**

# Input Ratings / Characteristics

Nominal Input Voltage		100-240Vac	Applicable for TN-, TT and IT mains networks
Input Voltage Range		85-276Vac	Continuously operating
Input Frequency	Nom.	50-60Hz	±3% range (47-63Hz)
Nominal DC Input Voltage		110-300Vdc	
DC input Voltage Range*		88-375Vdc	Continuously operating

### Output Load De-rating VS Surrounding Air Temperature

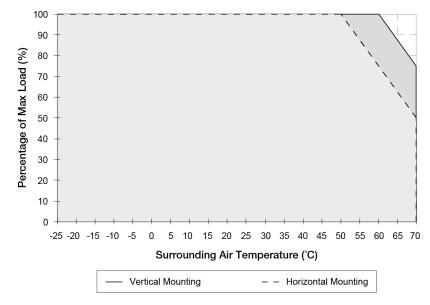

Fig. 5De-rating for Vertical Mounting Orientation> 60°C de-rate power by 2.5% / °C

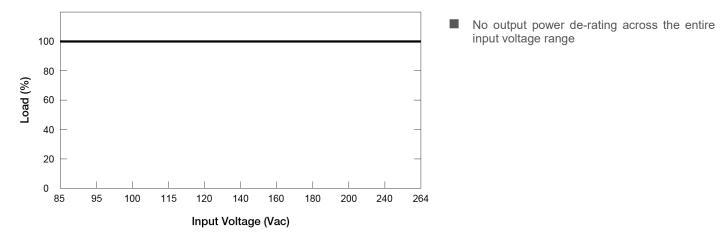

**De-rating for Horizontal Mounting Orientation** > 50°C de-rate power by 2.5% / °C

#### Note

- 1. Power supply components may degrade, or be damaged, when the power supply is continuously used outside the shaded region, refer to the graph shown in Fig. 5.
- 2. If the output capacity is not reduced when the surrounding air temperature exceeds its specification as defined on Page 5 under "Environment", the device will run into Over Temperature Protection. When activated, the output voltage will go into bouncing mode and will recover when the surrounding air temperature is lowered or the load is reduced as far as necessary to keep the device in working condition.
- 3. In order for the device to function in the manner intended, it is also necessary to keep a safety distance as recommended in the safety instructions while the device is in operation.
- 4. Depending on the surrounding air temperature and output load delivered by the power supply, the device can be very hot!
- 5. If the device has to be mounted in any other orientation, please contact **info@deltapsu.com** for more details.

### Output Load De-rating VS Input Voltage

# **Assembly & Installation**

The power supply unit (PSU) can be mounted on 35mm DIN rails in accordance with EN 60715. For Vertical Mounting, the device should be installed with input terminal block at the bottom. For Horizontal Mounting, the device should be installed with input terminal block on the left side.

Each device is delivered ready to install.

- 1. Tilt the unit upwards and insert it onto the DIN rail. Snap on the DIN rail as shown in Fig. 6.1.
- 2. Push downwards until stopped.
- 3. Press against the bottom front side for locking.
- 4. Shake the unit slightly to ensure that it is secured.
- 5. To uninstall, pull or slide down the latch with screw driver as shown in Fig. 6.2. Then slide the power supply unit (PSU) in the opposite direction, release the latch and pull out the power supply unit (PSU) from the rail.

### Mounting

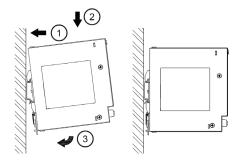

Fig. 6.1 Mounting

Dismounting

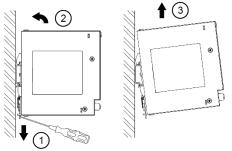

Fig. 6.2 Dismounting

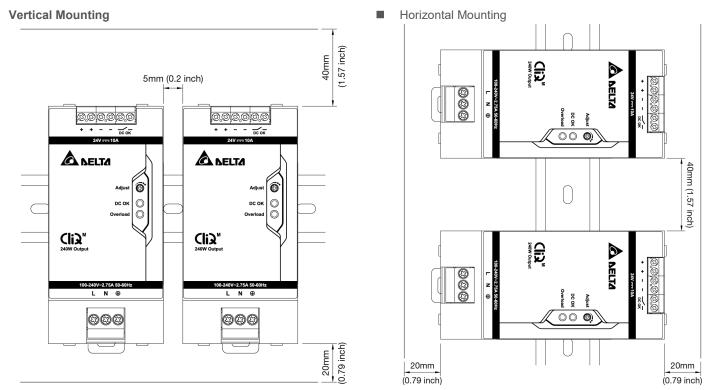

In accordance to EN 60950 / UL 60950, flexible cables require ferrules.

Use appropriate copper cables designed to sustain operating temperature of:

- 1. 60°C, 60°C / 75°C for USA
- 2. At least 90°C for Canada and IEC/EN61010-1, IEC/EN61010-2-201.

# Safety Instructions

- ALWAYS switch mains of input power OFF before connecting and disconnecting the input voltage to the device. If mains are not turned OFF, there is risk of explosion / severe damage.
- If the unit is used in a manner not specified by the manufacturer, the protection provided by the equipment may be impaired.
- To guarantee sufficient convection cooling, please refer to the following instructions to ensure sufficient clearance around the device.

<u>Vertical Mounting:</u> 40mm (1.57 inch) above and 20mm (0.79 inch) below the device as well as a lateral distance of 5mm (0.2 inch) to other units. In case the adjacent device is a heat source, the lateral distance will be 15mm (0.6 inch). <u>Horizontal Mounting:</u> 40mm (1.57 inch) above and below the device as well as a lateral distance of 20mm (0.79 inch) to other units.

- The external enclosure where the unit will be installed shall meet the requirements for mechanical, electrical and fire enclosure.
- Note that the enclosure of the device can become very hot depending on the surrounding air temperature and output load connected to the device. Risk of burns!
- The main power must be turned off before connecting or disconnecting wires to the terminals.
- DO NOT insert any objects into the unit.
- Dangerous voltages present for at least 5 minutes after disconnected all sources of power.
- The power supplies are built in units and must be installed in a cabinet or room (condensation free environment and indoor location) that is relatively free of conductive contaminants.

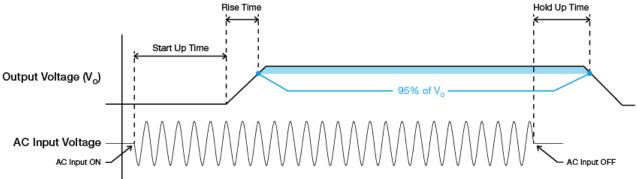

# **Functions**

# DC OK Relay Contacts and LED Indicator Characteristics

CliQ M Status	DC OK (Green LED)	Overload (Red LED)	DC OK Relay Contact	
Normal Operation	ON	OFF	Closed	
During Power Boost	ON	OFF	Closed	
Overload (Vout ≤ 90% of adjusted voltage)	OFF	ON	Open	
Output Short Circuit	OFF	ON	Open	
Over Temperature	OFF	Flashing	Open	
No Input Power	OFF	OFF	Open	

### Graph illustrating the Start-up Time, Rise Time, and Hold-up Time

# Start-up Time

The time required for the output voltage before output voltage rise up, after the input voltage is applied.

# **Rise Time**

The time required for the output voltage to change from 0% to 95% of its final steady state set value.

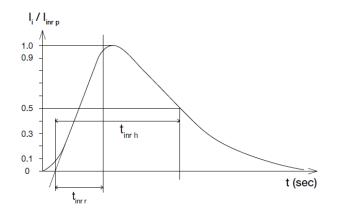

### Hold-up Time

Time between the collapse of the AC input voltage, and the output falling to 95% of its steady state set value.

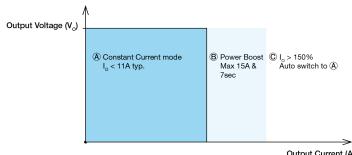

#### Inrush Current

Inrush current is the peak, instantaneous, input current measured and, occurs when the input voltage is first applied. For AC input voltages, the maximum peak value of inrush current will occur during the first half cycle of the applied AC voltage. This peak value decreases exponentially during subsequent cycles of AC voltage.

#### **Overload & Overcurrent Protections (Auto-Recovery)**

The power supply's Overload (OLP) and Overcurrent (OCP) Protections will be activated when output current is > 150% of Io (output current). Upon such an occurrence, the output current will limit to 11A typ., refer to  $\triangle$  and V<sub>0</sub> (output voltage) will start to droop and operate in "Constant Current mode". The power supply will recover once the fault condition due to OLP or OCP is removed, then Io is back within the specified range

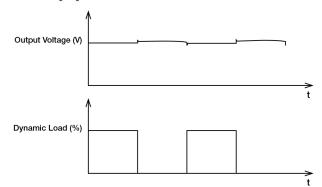

Output Current (A)

#### Dynamic Response

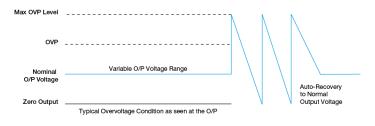

The power supply output voltage will remains within ±5% of its steady state value, when subjected to a dynamic load from 0% to 100% of its rated current.

#### 50% duty cycle / 5Hz to 1KHz

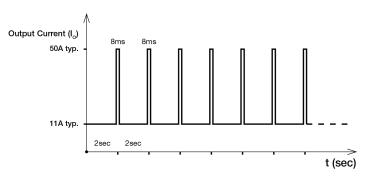

#### **Overvoltage Protection (Auto-Recovery)**

The power supply's overvoltage circuit will be activated when its internal feedback circuit fails. The output voltage shall not exceed its specifications defined on Page 6 under "Protections".

### Short Circuit Protection (Auto-Recovery)

The power supply's output Short Circuit Protection function also provides protection against short circuits. When a short circuit is applied, the output current will operate in "Hiccup mode". The power supply will return to normal operation after the short circuit is removed

#### Over Temperature Protection (Auto-Recovery)

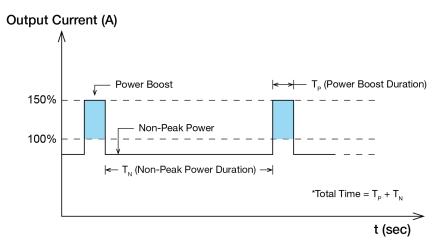

As described in load de-rating section, the power supply also has Over Temperature Protection (OTP). In the event of a higher operating temperature at 100% load, the power supply will run into OTP when the operating temperature is beyond what is recommended in the de-rating graph. When activated, the output voltage will go into bouncing mode until the temperature drops to its normal operating temperature as recommended in the de-rating graph.

#### **Power Boost**

Power Boost is the reserve power available constantly that allows reliable startup to support sudden and short spike of loads with high inrush current typically during turn on to remove the need of more expensive higher rated power supply unit. After the output has reached its steady state set value, the power supply can support surge loads with a higher short-term power demand up to 150% of maximum rated load (Io Max), for a maximum duration of 7 seconds. If the power boost lasts longer than maximum duration, the output current will limit to 11A typ. and Vo (output voltage) will start to droop and operate in "Constant Current mode". The Power Boost is repetitive, need to maintain the duty cycle & recovery time to ensure that average (R.M.S) output power shall not exceed the continuous maximum, see duty cycle calculation below.

$$Duty cycle (\%) = \frac{T_P}{Total Time}$$

Average Output Power 
$$(P_{Avg}) = \frac{(Power Boost \times T_P) + (Non-Peak Power \times T_N)}{Total Time}$$

OR

Non-Peak Power = 
$$\frac{(P_{Avg} \times Total Time) - (Power Boost \times T_P)}{T_N}$$

#### An example of Power Boost and Average Output Power

Power Boost	Peak Power (W <sub>P</sub> )	Power Boost Duration (T <sub>P</sub> )	Duty Cycle	Non-Peak Power (W <sub>N</sub> )	Non-Peak Power Duration (T <sub>N</sub> )	Total Time (T)
150%	360	7 sec	10%	226W	60 sec	67 sec
150%	360	7 sec	30%	188W	16 sec	23 sec
120%	288	7 sec	10%	234W	60 sec	67 sec
120%	288	7 sec	30%	219W	16 sec	23 sec

It is not recommended to extend the duration of Power Boost to be longer than the specified duty cycle calculation, this may cause damage to the PSU.

#### Advanced Power Boost (APB)

With multiple loads connected in a system and due to one of fault load a large outrush current is drawn (demanded), this will be detected by APB. This APB can trip the external output protection device with appropriate rating based on system load. Thus preventing the system from shutting down while other connected current paths continue to operate without interruption.

The following waveforms demonstrate the behavior.

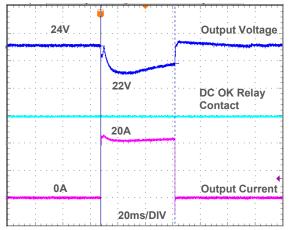

Fig. 8.1 APB 200% of nominal output current for 50ms

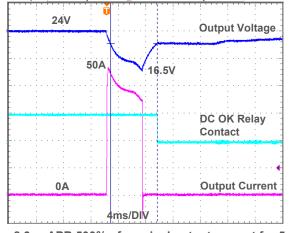

Fig. 8.3 APB 500% of nominal output current for 5ms

#### **External Input Protection Device**

The unit is protected with internal fuse (not replaceable) at L pin and it has been tested and approved on 20A (UL) and 16A (IEC) branch circuits without additional protection device. An external protection device is only required if the supplying branch has an ampacity greater than above. Thus, if an external protective device is necessary, or, utilized, please refer a minimum value in instruction sheet with 6A B- or 4A C- characteristic breaker.

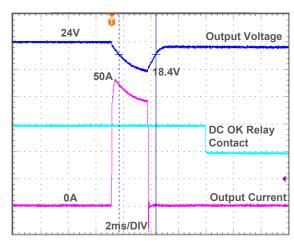

Fig. 8.2 APB 500% of nominal output current for 2ms

### **Operating Mode**

#### Redundant Operation

In order to ensure proper redundant operation for the power supply units (PSUs), the output voltage difference between the two units must be kept at 0.45~0.50V for these 24V supplies. Follow simple steps given below to set them up for the redundant operation:

#### Step 1.

Measure output voltage of PSU 1 and PSU 2. If PSU 1 is the master unit, then V<sub>0</sub> of PSU 1 must be higher than PSU 2. In order to set the output voltage, individually connect each power supply to 50% of rated load at any line voltage, and set the PSU 1 and PSU 2 output voltage.

#### Step 2.

Connect the power supply units PSU 1 and PSU 2 to Vin 1 & Vin 2, respectively, of the DRR-20N (or 20A) module shown on the right of above diagram.

#### Step 3.

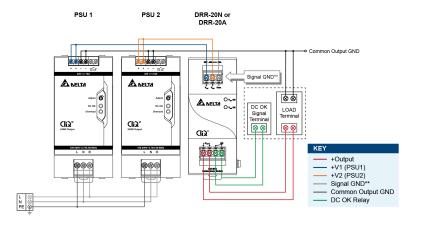

Connect the system load to  $V_{out}$ . Please note that output voltage  $V_{out}$  from DRR module will be =  $V_0$  (output voltage of power supply) –  $V_{drop}^*$  (in DRR module).

\*Vdrop will vary from 0.60V to 0.90V (Typical 0.65V) depending on the load current and surrounding air temperature.

#### Parallel Operation

The power supply units (PSUs) can also be used for parallel operation in order to increase the output power. The difference in output voltage between the two units must be kept to within 25mV of each other. This difference must be verified with the same output load connected independently to each unit.

Parameters such as EMI, inrush current, leakage current, PARD, start up time will be different from those on the datasheet, when two units are connected in parallel. The user will need to verify that any differences will still allow the two power supplies connected in parallel will work properly in their product/application.

\*\*The Signal GND in the DRR module is for the built-in LED and DC OK signals. The Output GND terminals from the two PSU's do not need to be connected to the Signal GND terminal.

#### Fig. 9 Redundant Operation Connection Diagram

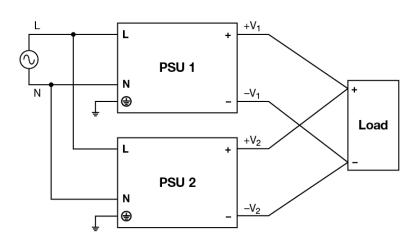

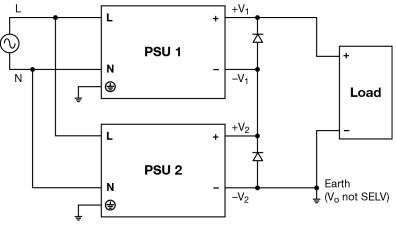

Fig. 10 Parallel Operation Connection Diagram

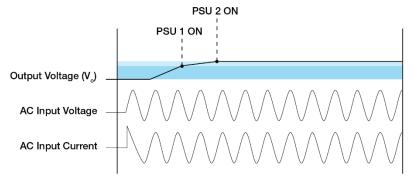

#### Fig. 11 Series Operation Connection Diagram

#### Series Operation

Delta's CliQ M can be connected in series to increase the output voltage as shown in figure above. Power supply from the same product series only be used and with the same rated output current. The maximum load current should not exceed the smallest rated output current. Any number of power supplies can be connected in series, user must note that output voltage > 60Vdc will not meet SELV requirements and could be dangerous to user, the total voltage shall not exceed 150Vdc. Installation a protection against the touching is a must and connect the output ground to earth when output voltage is not SELV. A diode in reverse bias must be added across output terminals of each power supply, this is to prevent -V voltage being applied to other power supply in fault conditions such as short circuit across load. During short circuit  $-V_1 \& +V_1$  will come across  $+V_2 \& -V_2$  which means connecting 2 power supplies in opposite polarity and may cause damage to power supply. With reverse bias diodes in place the voltage across each power supply will be restricted to one diode drop – approximately 0.7V to 1.0V. It is recommended to provide sufficient de-rating for diodes use 2 times the voltage rating of series output voltage. E.g. the two 24V power supplies are connected in series, the total voltage is 48 volts. Hence, recommended to use diodes with reverse voltage rating of 100 volts can be used.

During the short circuit condition, the current through diodes will be large, hence it is recommended that diodes to be least twice the current rating of the power supply.

The turn ON would be non-monotonic as the power supply with the fastest startup time and rise time will turn on first. As a result, the startup waveform with 2 power supplies connected in series would see a step.

User must consider to verify parameters such as EMI, inrush current, leakage current, PARD, start up time would differ from datasheet numbers as multiple power supplies in series.

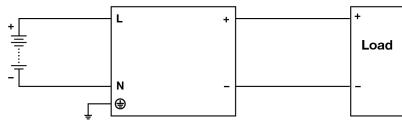

Fig. 12 DC Input Operation Connection Diagram

#### DC Input Operation

#### Step 1.

Use a battery or similar DC source.

#### Step 2.

Connect +pole to L and -pole to N.

#### Step 3.

Connect the PE terminal to an earth wire or to the machine ground.

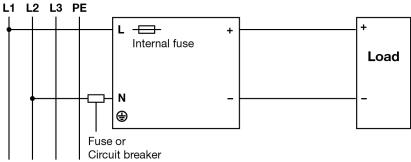

Fig. 13 2 of 3 Phase System Input Operation Connection Diagram

### 2 of 3 Phase System Input Operation

Delta's CliQ M can use on 2 of 3 phase system. Please refer to the following step.

#### Step 1.

The supplying voltage is below the maximum rated input. The input voltage shall be below 240Vac +10%.

# Step 2.

The external protector is needed on N input line to secure a safety. N line has no protection of a fuse internally. An appropriate fuse or circuit breaker should be connected on N input line like the following.

### Others

#### **Conformal Coating**

#### The Protective Coating Technology

Delta Electronics Group has designed the perfect dipping technique which penetrates everywhere including under device, and prevents leakage. The conformal coating dipping can be applied to PCBAs or circuit board. The coating preserves the performance of precision electronic primarily by preventing ionizable contaminants such as salt from reaching circuit nodes, where the material slumps around sharp edges. This can be a problem especially in highly conversing atmosphere.

#### PFC - Norm EN 61000-3-2

#### Line Current Harmonic content

Typically, the input current waveform is not sinusoidal due to the periodical peak charging of the input capacitor. In industrial environment, complying with EN 61000-3-2 is only necessary under special conditions. Complying to this standard can have some technical drawbacks, such as lower efficiency as well as some commercial aspects such as higher purchasing costs. Frequently, the user does not profit from fulfilling this standard, therefore, it is important to know whether it is mandatory to meet this standard for a specific application.

#### Attention

Delta provides all information in the datasheets on an "AS IS" basis and does not offer any kind of warranty through the information for using the product. In the event of any discrepancy between the information in the catalog and datasheets, the datasheets shall prevail (please refer to **www.DeltaPSU.com** for the latest datasheets information). Delta shall have no liability of indemnification for any claim or action arising from any error for the provided information in the datasheets. Customer shall take its responsibility for evaluation of using the product before placing an order with Delta.

Delta reserves the right to make changes to the information described in the datasheets without notice.
