

Features

- **Single-Supply Operation from +3V ~ +28V**
 - **Dual-Supply Operation from $\pm 1.5V \sim \pm 14V$**
 - **Gain-Bandwidth Product: 1MHz (Typ)**
 - **Low Input Bias Current: 45nA (Typ)**
 - **Low Offset Voltage: 5mV (Max)**
 - **Quiescent Current: 120 μ A per Amplifier (Typ)**
 - **Operating Temperature: -25°C ~ +85°C**
- **Small Package:**
 - LM321 Available in SOT23-5 Package**
 - LM358 Available in SOP-8 and MSOP-8 Packages**
 - LM324 Available in SOP-14 Package**

General Description

The LM321/358/324 family have a high gain-bandwidth product of 1MHz, a slew rate of 0.2V/ μ s, and a quiescent current of 120 μ A/amplifier at 5V. The LM321/358/324 family is designed to provide optimal performance in low voltage and low noise systems. The maximum input offset voltage is 5mV for LM321/358/324 family. The operating range is from 3V to 28V. The LM321 single is available in Green SOT-23-5 package. The LM358 Dual is available in Green SOP-8 and MSOP-8 packages. The LM324 Quad is available in Green SOP-14 package.

Applications

- Walkie-Talkie
- Battery Management Solution
- Transducer Amplifiers
- Summing Amplifiers
- Multivibrators
- Oscillators
- Portable Systems

Pin Configuration

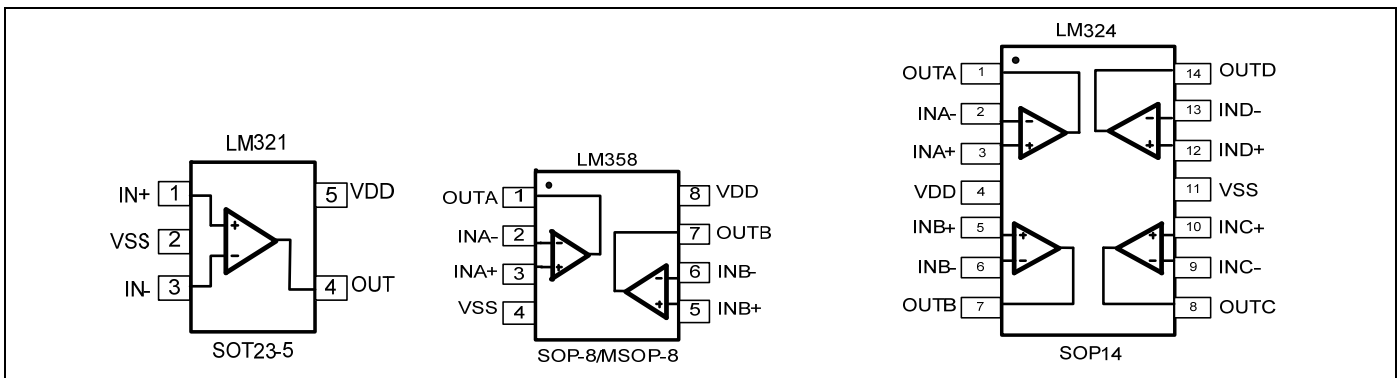

Figure 1. Pin Assignment Diagram

Absolute Maximum Ratings

Condition	Symbol	Max
Power Supply Voltage	V _{cc}	± 16V or 32V
Differential input voltage	V _{I(DIFF)}	32V
Input Voltage	V _I	-0.3V~32V
Operating Temperature Range	T _{opr}	-25°C ~+85°C
Storage Temperature Range	T _{stg}	-65°C ~+150°C

Note: Stress greater than those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions outside those indicated in the operational sections of this specification are not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Package/Ordering Information

Type Number	Package	Packing	Description
LM321M5	SOT-23-5	Tape Reel	Single
LM358AM	SOP-8	Tape Reel	Dual
LM358M	SOP-8	Tape Reel	Dual
LM358AMM	MSOP-8	Tape Reel	Dual
LM324AM	SOP-14	Tape Reel	Quad
LM324M	SOP-14	Tape Reel	Quad

Electrical Characteristics

 (At $V_S = +14V$, $T_A = 25^\circ C$, unless otherwise noted.)

Typical Performance characteristics

Application Note

Size

LM321/358/324 family series op amps are unity-gain stable and suitable for a wide range of general-purpose applications. The small footprints of the LM321/358/324 family packages save space on printed circuit boards and enable the design of smaller electronic products.

Power Supply Bypassing and Board Layout

LM321/358/324 family series operates from a single 3V to 28V supply or dual $\pm 1.5V$ to $\pm 14V$ supplies. For best performance, a $0.1\mu F$ ceramic capacitor should be placed close to the V_{DD} pin in single supply operation. For dual supply operation, both V_{DD} and V_{SS} supplies should be bypassed to ground with separate $0.1\mu F$ ceramic capacitors.

Low Supply Current

The low supply current (typical $120\mu A$ per channel) of LM321/358/324 family will help to maximize battery life.

Operating Voltage

LM321/358/324 family operates under wide input supply voltage (3V to 28V). In addition, all temperature specifications apply from $-25^\circ C$ to $+85^\circ C$. Most behavior remains unchanged throughout the full operating voltage range. These guarantees ensure operation throughout the single Li-Ion battery lifetime.

Capacitive Load Tolerance

The LM321/358/324 family is optimized for bandwidth and speed, not for driving capacitive loads. Output capacitance will create a pole in the amplifier's feedback path, leading to excessive peaking and potential oscillation. If dealing with load capacitance is a requirement of the application, the two strategies to consider are (1) using a small resistor in series with the amplifier's output and the load capacitance and (2) reducing the bandwidth of the amplifier's feedback loop by increasing the overall noise gain. Figure 2. shows a unity gain follower using the series resistor strategy. The resistor isolates the output from the capacitance and, more importantly, creates a zero in the feedback path that compensates for the pole created by the output capacitance.

Figure 2. Indirectly Driving a Capacitive Load Using Isolation Resistor

The bigger the R_{ISO} resistor value, the more stable V_{OUT} will be. However, if there is a resistive load R_L in parallel with the capacitive load, a voltage divider (proportional to R_{ISO}/R_L) is formed, this will result in a gain error.

The circuit in Figure 3 is an improvement to the one in Figure 2. R_F provides the DC accuracy by feed-forward the V_{IN} to R_L . C_F and R_{ISO} serve to counteract the loss of phase margin by feeding the high frequency component of the output signal back to the amplifier's inverting input, thereby preserving the phase margin in the overall feedback loop. Capacitive drive can be increased by increasing the value of C_F . This in turn will slow down the pulse response.

Figure 3. Indirectly Driving a Capacitive Load with DC Accuracy

Typical Application Circuits

Differential amplifier

The differential amplifier allows the subtraction of two input voltages or cancellation of a signal common to the two inputs. It is useful as a computational amplifier in making a differential to single-end conversion or in rejecting a common mode signal. Figure 4. shows the differential amplifier using LM321/358/324 family.

Figure 4. Differential Amplifier

$$V_{OUT} = \left(\frac{R_1+R_2}{R_3+R_4}\right) \frac{R_4}{R_1} V_{IN} - \frac{R_2}{R_1} V_{IP} + \left(\frac{R_1+R_2}{R_3+R_4}\right) \frac{R_3}{R_1} V_{REF}$$

If the resistor ratios are equal (i.e. $R_1=R_3$ and $R_2=R_4$), then

$$V_{OUT} = \frac{R_2}{R_1} (V_{IP} - V_{IN}) + V_{REF}$$

Low Pass Active Filter

The low pass active filter is shown in Figure 5. The DC gain is defined by $-R_2/R_1$. The filter has a -20dB/decade roll-off after its corner frequency $f_c = 1/(2\pi R_3 C_1)$.

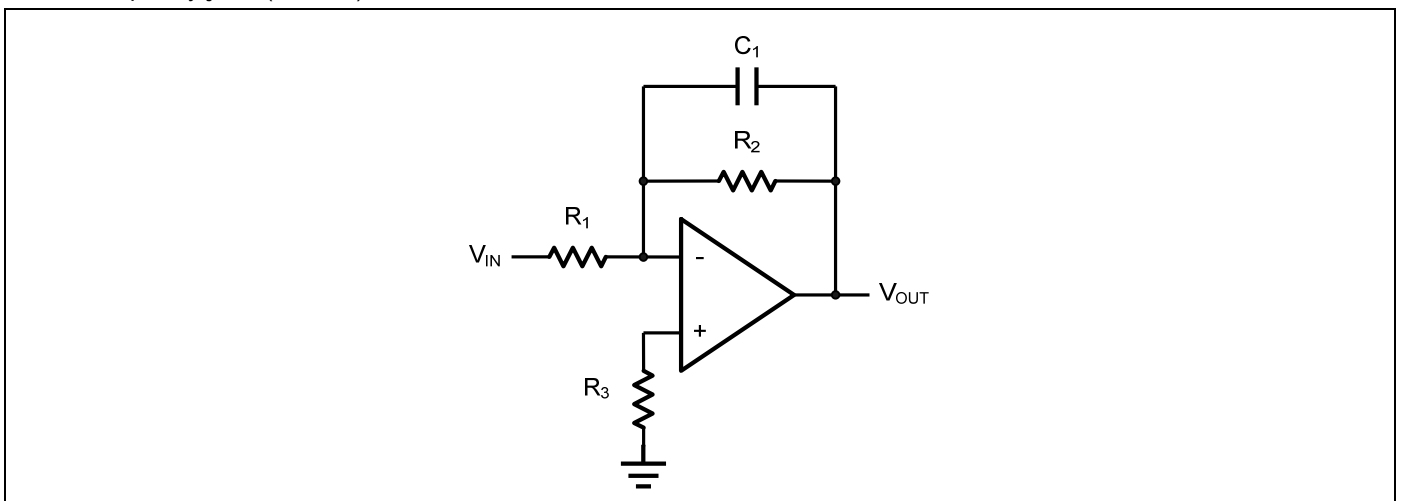

Figure 5. Low Pass Active Filter

Instrumentation Amplifier

The triple LM321/358/324 family can be used to build a three-op-amp instrumentation amplifier as shown in Figure 6. The amplifier in Figure 6 is a high input impedance differential amplifier with gain of R_2/R_1 . The two differential voltage followers assure the high input impedance of the amplifier.
