MICROCHIP

TC51

1µA Voltage Detector with Output Delay

Features

- Precise Detection Thresholds: ±2.0%
- Small Package: 3-Pin SOT-23A
- Low Supply Current: Typ. 1µA
- Wide Detection Range: 1.6V to 6.0V
- Wide Operating Voltage Range: 0.7V to 10V
- Built-in Delay Circuit: 50msec to 200 msec
- Open-Drain Output

Applications

- Battery Voltage Monitoring
- Microprocessor Reset
- System Brown-out Protection

Device Selection Table

Part Number	Package	Temp. Range
TC51-xxxxxxxxxx	3-Pin SOT-23A	-40°C to +85°C

Other output voltages are available. Please contact Microchip Technology Inc. for details.

Package Type

3-Pin SOT-23A

$\overline{V_{OUT}}$ V_{SS}

NOTE: 3-Pin SOT-23A is equivalent to the EIAJ SC-59.

General Description

The TC51 is a very low power, open drain output, CMOS voltage detector with built-in delay. It is particularly well-suited for battery powered applications because of its extremely low 1µA operating current and small surface-mount packaging. Each part is laser-trimmed to the desired threshold voltage, which can be specified from 1.6V to 6.0V. The standard built-in output delay is 50msec-200msec.

The device includes a comparator, low-current high-precision reference, laser-programmed voltage divider, hysteresis circuit and output driver with digital delay timer.

In operation, the TC51's output ($\overline{V_{OUT}}$) remains in the logic HIGH state as long as V_{IN} is greater than the specified threshold voltage (V_{DET}-). When V_{IN} falls below V_{DET}-, the output is immediately driven to a logic LOW. $\overline{V_{OUT}}$ remains LOW until V_{IN} rises above V_{DET}- by an amount V_{HYST}, whereupon it returns to a logic HIGH after expiration of the built-in delay time.

Functional Block Diagram
TC51

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

Input Voltage ....+12V

Output Current 50mA

Output Voltage: Open Drain ....(V_{SS} – 0.3V) to 12V

Power Dissipation ($T_A \leq 70°C$):
    3-Pin SOT-23A 240mW

Operating Temperature Range.............-40°C to +85°C

Storage Temperature Range..............-65°C to +150°C

*Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

TC51 ELECTRICAL SPECIFICATIONS

Electrical Characteristics: T_A = 25°C, unless otherwise specified.

Symbol	Parameter	Min	Typ	Max	Units	Test Conditions
V_{IN}	Operating Voltage	0.7	—	10.0	V	(V_{DET}-) = 1.6 to 6.0V
I_{SS}	Quiescent Current	—	0.9	2.6	µA	V_{IN} = 1.5V
		—	1.0	3.0		V_{IN} = 2.0V
		—	1.3	3.4		V_{IN} = 3.0V
		—	1.6	3.8		V_{IN} = 4.0V
		—	2.0	4.2		V_{IN} = 5.0V
V_{DET}-	Threshold Voltage	V_T x 0.98	V_T ± 0.5%	V_T x 1.02	V	Note 1
V_{HYST}	Hysteresis Voltage	V_{DET}- x 0.02	V_{DET}- x 0.05	V_{DET}- x 0.08	V	
I_{OUT}	Output Current	—	2.2	—	mA	V_{OL} = 0.5V, V_{IN} = 1.0V
		—	7.7	—		V_{IN} = 2.0V
			10.1			V_{IN} = 3.0V
			11.5			V_{IN} = 4.0V
			13.0			V_{IN} = 5.0V
T_{DLY}	Delay Time	50	—	200	msec	Standard
T_C (V_{DET}-)	Tempco of (V_{DET}-)	—	±100	—	ppm/°C	-40°C $\leq T_A \leq$ 85°C

Note 1: V_T is the factory programmed threshold voltage setting.

2.0   PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1:   PIN FUNCTION TABLE

Pin No. (3-Pin SOT-23A)	Symbol	Description
1	$\overline{V_{OUT}}$	Digital output. This output goes low when V_{IN} drops below V_{DET}- and returns high when V_{IN} rises above V_{DET}- + V_{HYST}. (See Figure 3-1, Timing Diagram).
2	V_{SS}	Ground terminal.
3	V_{IN}	Analog input. This pin is both the power supply input and the voltage to be monitored.

TC51

3.0 DETAILED DESCRIPTION

In normal steady-state operation, when $V_{IN} > V_{DET}$-, the output is high, see Figure 3-1. If and when the input falls below V_{DET}-, the output pulls down (Logic 0) to V_{SS}. Generally, V_{OUT} can pull down to within 0.5V of V_{SS} at rated output current and input voltage. (Also see Section 1.0, Electrical Characteristics).

The output, $\overline{V_{OUT}}$, stays valid until the input voltage falls below the minimum operating voltage, V_{INMIN}, of 0.7V. Below this minimum operating voltage, the output is undefined. During power-up or anytime V_{IN} has fallen below V_{INMIN}, $\overline{V_{OUT}}$ will remain undefined until V_{IN} rises above V_{INMIN}, at which time the output becomes valid. $\overline{V_{OUT}}$ is maintained in its active low state while $V_{INMIN} < V_{IN} < V_{DET}$+. ($V_{DET}$+ = V_{DET}- + V_{HYST}). If and when the input rises above V_{DET}+, the output will assume its inactive state after Delay Time (T_{DLY}).

FIGURE 3-1: TIMING DIAGRAM

4.0   APPLICATIONS INFORMATION

4.1   Processor RESET Supervisor

Figure 4-1 shows the TC51 used as a processor reset supervisor. Because the TC51 is available in threshold settings of 1.6V to 6.0V, the user can choose the reset single threshold setting best suited to the system power supply voltage at hand. Also, the 1μA supply current is significantly lower than its nearest competitor.

As shown in the timing diagram (Figure 3-1), $\overline{V_{OUT}}$ is low for voltages between 0.7V and $V_{DET}+$. The TC51 activates its on-board delay timer once the power supply voltage is within tolerance (i.e., greater than $V_{DET}+$). $\overline{V_{OUT}}$ is released after delay time (T_{DLY}).

Should the power supply voltage momentarily dip ("brown-out" condition), the TC51 immediately drives and holds the processor RESET input low. RESET is released after the power supply voltage is again within tolerance, and after the delay timer expires. RESET is driven and held low when power fails (power-off or "blackout"), and is maintained down low to a supply voltage of 0.7V.

Sales and Support

Data Sheets
Products supported by a preliminary Data Sheet may have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office
2. The Microchip Corporate Literature Center U.S. FAX: (480) 792-7277
3. The Microchip Worldwide Site (www.microchip.com)

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

New Customer Notification System

Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999 and Mountain View, California in March 2002. The Company's quality system processes and procedures are QS-9000 compliant for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs, microperipherals, non-volatile memory and analog products. In addition, Microchip's quality system for the design and manufacture of development systems is ISO 9001 certified.
