DG3157

High-Speed, Low R_{ON}, SPDT Analog Switch

(2:1 Multiplexer/Demultiplexer Bus Switch)

DESCRIPTION

The DG3157 is a high-speed single-pole double-throw, low power, TTL-Compatible bus switch. Using sub-micro CMOS technology, the DG3157 achieves low on-resistance and negligible propagation delay.

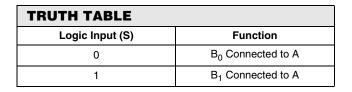

The DG3157 can handle both analog and digital signals and permits signals with amplitudes of up to V_{CC} to be transmitted in either direction.

When the Select pin is low, B₀ is connected to the output A pin. When the Select pin is high, B1 is connected to the output A pin. The path that is open will have a highimpedance state with respect to the output. Make-beforebreak is guaranteed. An eptiaxial layer prevents latch-up.

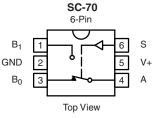

FEATURES

- Halogen-free According to IEC 61249-2-21
- Direct cross to industry standard SN74LVC1G3157, NC7SB3157, NLASB3175, PI5A3157, and STG3157
- SC-70 6-lead package
- 1.65 V to 5.5 V V_{CC} operation
- 5 Ω connection between ports
- Minimal propagation delay
- Break-before-make switching
- Zero bounce in flow-through mode

otes:								I

Notes:

a. Room = 25 °C, Full = as determined by the operating suffix.

b. The algebraic convention whereby the most negative value is a minimum and the most positive a maximum, is used in this data sheet.

c. Typical values are for design aid only, not guaranteed nor subject to production testing.

d. Guarantee by design, nor subjected to production test.

e. V_{IN} = input voltage to perform proper function.

f. Guaranteed by design and not production tested. The bus switch propagation delay is a function of the RC time constant contributed by the on-resistance and the specified load capacitance with an ideal voltage source (zero output impedance) driving the switch.

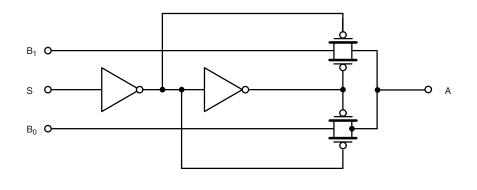

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

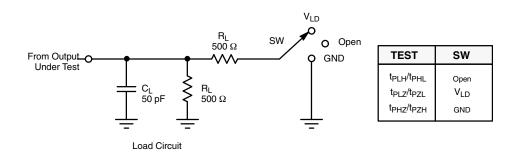

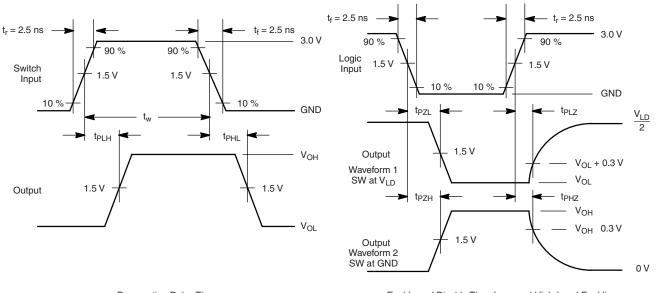

Figure 2. AC Test Circuit

Propagation Delay Times

Enable and Disable Time-Low- and High-Level Enabling

Notes:

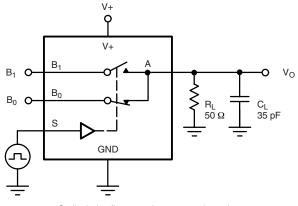

- C_L includes probe and jig capacitance.
- Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control.
- Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- All input pulses are supplied by generators having the following characteristics: PRR \leq 10 MHz, Z_O = 50 Ω .
- The outputs are measured one at a time with one transition per measurement.
- \bullet t_{PLZ} and t_{PHZ} are the same as $t_{dis}.$
- \bullet t_{PZL} and t_{PZH} are the same as $t_{\text{dis}}.$
- \bullet t_{PLH} and t_{PHL} are the same as $t_{dis}.$
- V_{LD} = 2 V+.
